Name: Sarthak Gharat

UID: 2021700025

**Branch: CSE DS** 

**Expt 4: Crime Data** 

**Problem Statement:** Create basic charts using R programming language on dataset Crime or Police / Law and Order

- Basic Bar chart, Pie chart, Histogram, Scatter plot, Bubble plot
- Write observations from each chart

Software Used: R

**Dataset Used:** Indian Crimes Dataset

## 1. Bar Chart

```
# Bar chart for the number of crimes per city
ggplot(crime_data, aes(x = City)) +
  geom_bar(fill = "skyblue") +
  labs(title = "Number of Crimes per City", x = "City", y = "Number of Crimes") +
  theme_minimal()
```

Delhi and Mumbai have the highest crime rates.

2. Pie Chart

```
# Pie chart for the distribution of crimes by weapon used
weapon_distribution <- table(crime_data$Weapon.Used)

# Create the pie chart
pie(weapon_distribution,
    labels = names(weapon_distribution),
    main = "Distribution of Crimes by Weapon Used",
    col = rainbow(length(weapon_distribution)))</pre>
```

Distribution of Crimes by Weapon Used

There is almost equal distribution in the means used.

## 3. Histogram

```
ggplot(crime_data, aes(x = Victim.Age)) +
    geom_histogram(binwidth = 5, fill = "lightblue", color = "black") +
    labs(title = "Distribution of Victim Ages", x = "Victim Age", y = "Count") +
    theme_minimal()
```

It's somewhat a flat normal distribution over age.

## 4. Scatter Plot

```
# Scatter plot for victim age vs police deployed
ggplot(crime_data, aes(x = Victim.Age, y = Police.Deployed)) +
geom_point(color = "purple") +
labs(title = "victim Age vs Police Deployed", x = "Victim Age", y = "Police Deployed") +
theme_minimal()

Victim Age vs Police Deployed

**Scatter plot for victim age vs Police.Deployed) +
geom_point(color = "purple") +
labs(title = "victim Age vs Police Deployed", x = "Victim Age", y = "Police Deployed") +
theme_minimal()

**Victim Age vs Police Deployed*

**Scatter plot for victim age vs Police.Deployed) +
geom_point(color = "purple") +
labs(title = "victim Age vs Police Deployed", x = "Victim Age", y = "Police Deployed") +
theme_minimal()

**Victim Age vs Police Deployed*

**Victim Age vs Police Deplo
```

The number of police deployed is almost uniform with victim age.

## 5. Bubble Plot

```
# Bubble plot for crime type, victim age, and police deployed
ggplot(crime_data, aes(x = Victim.Age, y = Police.Deployed, size = Crime.Code, color = Crime.Description))
geom_point(alpha = 0.6) +
labs(title = "Bubble Plot of Victim Age vs Police Deployed", x = "Victim Age", y = "Police Deployed", si
theme_minimal()

Bubble Plot of Victim Age vs Police Deployed
